

Colony Oneway™ Peg Fitting Instructions

Colony Oneway™ Pegs are very unique in that they have a special offset internal machining process. Meaning they are thicker on the bottom & much thinner on the top. You must always make sure they are fitted the correct way.

You must always use the supplied locator bolts or in the case of the chain tensioner models, they must be fitted on the correct side. (Left or Right) The non-tensioner models have markings showing where to place your locator bolt dependant on what side you are running your peg.

Pic A

Right Front (RF), Left Rear (LR), Left Front (LF) & Right Rear (RR) See Pic A for details.

Note: 10mm models only have (L) or (R) markings

Pic B

Fit your locator bolt in relation to what side your peg will be on your bike as shown in Pic B.

Pic C

Tighten your peg as per normal on your bike. One last way to make sure they are fitted correctly is that the logo should always be towards the top away from where you will be grinding. See Pic C for details.

Please note: NO warranty will be given on any pegs that have been ground on the incorrect side due to them being fitted wrongly.

Enjoy your Oneway™ Pegs & have fun ! Yo yo !
